                                                                                                                                                                The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of a polymorphic variation associated with breast cancer. The method of the invention demonstrates cytostatic activity and may be useful for identifying a risk of, preventing and/or treating breast cancer and cancer metastasis. The methods may be utilized for gene therapy or RNA interference. The current sequence is that of an Extend primer of the invention which was used to genotype a human rho-family guaninenucleotide exchange factor D4, zinc and double PHD fingers, family 3 (DPF3) single nucleotide polymorphism (SNP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CPG motif., which can stimulate an immune response in animals of the order of primate, including humans. The immune cresponse is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation, cytokine cytokine production in plasmacytoid dendritic cells. The present in plasmacytoid dendritic cells. The present in plasmacytoid dendritic cells. The present cinvention describes immunocodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinar DNA oligo in an ascendification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining whether a product of a gene is involved in preventing a replication error in a cell comprises providing a specific inhibitor for the product and determining the level of expression of a marker gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       οĘ

                          The specification describes a method for determining whether a product of a gene is involved in preventing a replication error in a cell. The method comprises providing the cell with a specific inhibitor for the product and determining the level of functional expression of a marker gene in the cell, where the level of expression of the marker gene is dependent on the occurrence of the replication error. The method is used for determining whether a product of a gene is involved in preventing a replication error in a cell. The identified genes are useful for developing diagnostic tools, or as targets for drug development to manipulate cells on the basis of the presence or absence of function of the gene. ABZ2335-36 represents fragments of plasmids used to detect somatic instability, in the course of the invention
                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining if a gene product/compound is involved in preventing replication error in a cell, useful for treating cancer, comprises determining expression level of a marker gene in a cell treated with

product or compound is involved in preventing replication error in a cell. The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of a marker gene in the cell, where the expression level of the marker gene is dependent on the occurrence of a replication error. The invention is useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Caenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a molecular array with a plurality of molecules immobilized to a solid substrate, useful in genetic analysis, gene expression studies or the detection or typing of single nucleotide polymorphisms in a sample of

The molecular array produced by the method of the invention is useful for identifying one or more target molecules in a sample. The molecular array is also useful in genetic analysis, gene expression studies, identifying molecules which interact with a target molecule, detection/typing of single nucleotide polymorphisms, haplotyping and sequencing. The present DNA sequence represents a PCR primer that was

The present sequence is that of pyrene-anchored locked nucleic acid (LNA) coligo(dT) primer ON14, which was used in first-strand cDNA synthesis from enkaryotic mRNA. It includes compound '17d' at its 3' end, which is based on an LNA-type 2'-0,4'-C-methylene-beta-D-ribofuranosyl moiety. It is one of a set of such primers (see also ACC48482-85) that were used in an example from the invention to demonstrate improved reverse transcription of mRNA using pyrene-LNA anchored oligo(T) primers. The following results were observed: efficient priming on mRNAs with short poly(A) tails; curies resulting in an improved T20-VN anchor primer and thus avoiding reverse transcription of long poly(A) tracts; and improved reverse transcription of enkaryotic poly(A) tracts; and incorporated incorporated into nucleic acid strands. The novel LNA compounds can be used e.g. as into nucleic acid strands. The novel LNA compounds can be used e.g. as the primers, in sequencing, the synthesis of antisense oligonucleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid comprising a locked nucleic acid unit having a modified base that comprises an optionally substituted carbocyclic aryl moiety, or modified nucleobase or nucleosidic base other than oxazole/imidazole.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The present sequence is that of pyrene-anchored locked nucleic acid (LNA) cligo(dT) primer ON15, which was used in first-strand cDNA synthesis from eukaryotic mRNA. It includes compound '17d' at its 3' end, which is based on an LNA-type 2'-0,4'-C-methylene- beta-D-ribofuranosyl moiety. It is come of a set of such primers (see also ACG48482-84) that were used in an example from the invention to demonstrate improved reverse transcription of mRNA using pyrene-LNA anchored oligo(T) primers. The following results were observed: efficient priming on mRNAs with short poly(A) tails; efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T con this resulting in an improved T2O-VN anchor primer and thus avoiding reverse transcription of eukaryotic poly(A) tracts; and improved reverse transcription of eukaryotic poly(A) tracts; and improved reverse transcription of eukaryotic poly(A) tracts; and improved reverse transcription of eukaryotic poly(A) tracts; con continue avoiding that comprise unique base groups. Desirable nucleobase and nucleosidic chase substitutions can mediate universal hybridisation when incorporated into nucleic acid strands. The novel LNA compounds can be used e.g. as CRC primers, in sequencing, the synthesis of antisense oligonucleotides, and in Alamoneric
                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid comprising a locked nucleic acid unit having a modified base that comprises an optionally substituted carbocyclic aryl molety, or modified nucleobase or nucleosidic base other than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 22 BP; 0 A; 0 C; 0 G; 20 T; 0 U; 2 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for assessing a condition of a performance animal. The method involves determining in sample abundance of expressed target nucleic acid; transmitting digital sample signal to remote diagnostic server; processing digital sample signal to remote diagnostic server; processing digital sample signal at remotely located database to correlate digital signal with digital information and returning report of particular condition of animal. The method is useful for assessing a condition of a performance animal, and be an athletic ability and a condition that enhances, hinders, impedes or does not change an expected ability of the performance animal; and also normal, pre-clinical, overt progress and/or stage of disease, undiagnosed of unclassified conditions, presence of drugs, response to expriremental conditions. Diseases assessed by the states and response to environmental conditions. Diseases assessed by the invention include laminitis, lameless, viral or bacterial disease, gastrits, gastric ulcers, respiratory aliments, fractures, epistaxis, musculoskeletal damage or disorders and joint diseases. The present
                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assessing condition e.g. athletic ability, stage of disease, presence of drugs, response to exercise, response to vaccines, therapies, nutritional states, of performance animal involves analyzing nucleic acid expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Laminitis; viral disease; vaccine; bacterial disease; primer; epistaxis; gastritis; gastric ulcer; respiratory ailment; fracture; joint disease; musculoskeletal damage; ss.

```

```
The invention relates to methods and system for sequence presentation. The method involves extracting a partial sequence corresponding to a partial sequence of a target gene having an unidentified sequence, by homology search on a database. The methods are useful for presentation of sequences. It is also useful to prepare primer sequences to obtain a cDNA clone of a total coding region from a partial sequence of a gene having an unidentified sequence. The present sequence is a primer specific for human chromosome 10 RP-11-336AlO clone DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Presenting partial sequences by predicting and extracting exon sequences from a database, is useful to prepare primers to obtain a cDNA clone of total coding region from a partial sequence of an unidentified gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a microarray comprising a matrix of at least one CDNA probe from a set of probes immobilised to a solid surface in a predetermined order, where a row of pixels corresponds to replicates of one distinct probe from the set. The probes are complementary to nucleic acid sequences that are expressed differentially in aggressive as compared to non-aggressive types of clear cell renal carcinoma (CC-RCC) and that hybridise to the probes under high stringency conditions. The microarray is useful for the prognosis of patients with CC-RCC, wherein aggressive and non-aggressive CC-RCC tumour types are characterised by differential expression profiles of genes that hybridise with one or more probes immobilised on the microarray. The arrays are useful for sene expression profiling of tumour and normal tissues. The present sequence represents an oligo-dT primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a method of selecting genes expressed in a cancer cell, which involves characterising cancer based on the functioning of gene selection by comparing the expression of the selection of gene from the cancer cell with the expression of an identical selection of genes from a noncancerous cell or different type of cancer cell. The cathod is useful for targeting genes expressed in a cancer cell. The method is useful for targeting the therapy of cancer by using a selection of genes or their product sexpressed in a cancer cell, the gene selection of genes or their product sexpression of the selected gene or their products from the comparing the expression of the selected gene or their products enocancerous. The method is also useful for diagnosing, prognosing, monitoring and classifying a disease condition e.g. curous. The present sequence represents an anchored oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The invention relates to a method of producing (MI) a molecular array, involves: immobilizing to a solid phase a several molecules at a density which allows individual immobilized molecules to be individually resolved, where each molecule in the array is spatially addressable and the identity of each molecule is known or determined prior to immobilization; and optionally providing a molecular array comprising a several molecules immobilized to a solid phase at a density such that individual immobilized molecules are not capable of being individual resolved, and reducing the density of functional immobilized molecules in the array such that remaining individual functional immobilized molecules in the resulting array is spatially addressable and functional molecule in the resulting array is spatially addressable and the identity of each molecule is known or determined prior to the density reduction seep. The array efficiently resolve complex samples, separate correct signals from erroneous signals, eliminates need for sample correct signals from erroneous signals, eliminates need for sample of single molecule processes. This sequence represents anoligonucleotide used in the method of the invention. ö Producing molecular array by immobilizing to solid phase several known molecules at low density for allowing individual immobilized molecules to be individually resolved and spatially addressable. in vitro evolution; hyperlipidaemia; atherosolerosis; neurological disease; Alzheimer's disease; neurofibromatosis; Huntington's disease; depression; amyorrophic lateral sclerosis; multiple sclerosis; stroke; Parkinson's disease; multi-infarct dementia; cancer; organophosphate poisoning; antilipaemic; antiarteriosclerotic; neuroprotective; nootropic; cytostatic; anticonvulsant; antidepressant; antiparkinsonian; antidote. paraoxonase; PON1; praoxon; nerve agent; sarin; soman; Gaps ö Oligo dT PCR primer used in the cloning of PON1 genes Seq 11. / Match 0.7%; Score 20.2; DB 1; Length 22; Local Similarity 95.2%; Pred. Novel mutant of PON enzyme exhibiting increased substrate specificity to

This invention relates to novel mutant serum paraoxonase (PON1) nucleic acid molecules and the encoded proteins thereof. Specifically, it refers to enzymes that are calcium dependent phosphoricistcrases essential to the detoxification process of organophosphates such as the insecticide praoxon and the nerve agents sarin and soman. The present invention describes a method to identify mutated PONs that exhibit substrantially identical (or improved) substrate specificity in comparison with the wild crype PON and also those mutants that do not form aggregates when expressed in bacteria. In particular, the method employed an in vitro expressed in bacteria. In particular, the method employed an in vitro confuncing plasticity, catalytic activity and maintaining substrate binding. These mutants have been found to be useful for treating or preventing PON1-related diseases including hyperlipidaemia.

Confuncial plasticity, catalytic activity and maintaining substrate concupity mutiple scalerosis, mutiple scales including hyperlipidaemia.

Confuncial mutiple scalerosis, stroke, parkinson's disease, they exhibit antilipaemic, antiarteriosclerotic, neuroprotective, concurropic, cytostatic, anticonvulsant, antidepressant and case of conting and expression of a wild type PONI gene of the invention. This invention relates to a novel nucleic acid molecule that provides a plant with resistance to Xanthomonas when transfected into that plant. Specifically, it refers to a method of generating a plant that is resistant to Xanthomonas by transfecting the resistance gene Xa31 into the plant or transfecting Xa31 into a plant cell (or cells) and growing a plant thereof. The present invention describes an appropriate vector comprising a plant promoter operably linked to the nucleic acid, which can be used to produce the transgenic plant, preferably transgenic rice. As such, Xa31 acid is useful for generating transgenic plants that are resistant to bacterial blight disease caused by the bacterium Xanthomonas. This oligonucleotide sequence is a PCR primer given in an exemplification of the invention. NOTE: This sequence taken from example 7 differs from that given in the sequence listing of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types andorf different conditions, and identifying genes having a role in various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analyzing patterns, comparing gene expression by cell types under varied conditions, and identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of specific length.
cellular processes, including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                             DNA sequence analysis; sequencing; protein sequence; protein structure; gene typing; organ donation; bacteria identification; 16s rRNA; HLA; human leukocyte antigen; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                           The present invention describes human connexin 9 (1). (1) has cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activities. (1) and the polynucleotide encoding it (II) are applicable in the diagnosis and treatment of malignant tumour, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human connexin 9, which is used in an example from the present invention
                                                                                                                                                                                                                                                                               Human connexin 9 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene typing; polymorphic microsatellite loci; PML; disease; disease predisposition; microsatellite marker; prion disease; cystic fibrosis; malignant hyperthermia syndrome; metabolic disease; milk protein; hormone; transcription factor; pT7-blue-vector; cow; microsatellite; PCR; primer; ss.

The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and determining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or compared pML; and prediagnosis (M3) of diseases associated with gene that include PML; The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperhermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, cometabolic diseases, also to type genes that encode milk proteins, particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion cycle protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining

                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                           The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA semple containing at least one segment of (1); and determining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a classase and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion cycle protein (PPP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                          genes that contain polymorphic microsatellite loci, useful for fying predisposition to disease, by amplification and determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites for ca. 230 such bowine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.
                                   New dye-coupled modified nucleosides, nucleotides and oligo:nucleotides useful for synthesis of antisense DNA and RNA strands in presence of template, also for in-vivo and in-vitro detection of genetic material.
                                                                                                                                                              The sequence is an example of a dye coupled 3'-amino modified oligonucleotide, it can be used in the synthesis of DNA and RNA nucleosides, nucleotides and oligonucleotides and for the synthesis of opposite strands in the presence of template strand and in fluorescence microscopic and macroscopic detection in vivo and in vitro of genetic material. It is labelled with a fluorescent dye. See also AAQ25566 and AAQ25567. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic bovine DNA markers - used in genetic identification, gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotides (AAQ94201-Q94205) were synthesised for use as ligands. The ligands are covalently linked to a hapten (esp. a steroid hormone) to form a conjugate which is then immobilised on a solid support for interaction with antibodies against the hapten. Nucleic acid ligands and nucleic acids are also less likely to be recognised by the antibodies than are peptide ligands and nucleic acids are also less likely to undergo intramolecular organisation which interferes with accessibility of the hapten to the antibodies. For immunodiagnosis of cestradiol, the active hapten coestradiol-6-carboxymethoxime-N-hydroxymethoxime-N-hydroxymethoxime-N-hydroxymethoxime new great was used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Assay device for hapten or its specific antibodies - comprises support having competitive reagent immobilised via nucleic acid ligand to improve orientation and accessibility.
                                                                                                                                                                                                                                                                                                                                     /*tag= b /nctag= b /nctag= nthe glycosidic bonds between nucleotides are all in the alpha-anomer form"

                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                           Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T2; HLA; dQa; self-addressable electronic device; SAED; hybridisation;

```
The sequences represented by, AAQ90402-15 are synthetic DNA probes containing 5' amino termini. The sequences shown in AAQ90390-401 are synthetic DNA probes with 3' ribonucleoside termini. Thes sequences were specific for the polymorphisms of HLA gene dQa. The sequences were in the device of the invention. This is a self-addressable electronic device (SAED) that can be used to carry out multi-step and multiplex reactions, such as nucleic acid hybridisations. The advantages of this method are that these reactions can be carried out with complete and precise electronic control, and that the rate, specificity and sensitivity of these reactions are greatly improved at micro-locations
                                                                                                                        New self-addressable electronic devices - used for multi-step and multiplex reactions such as DNA hybridisation(s), clinical diagnostics and bio:polymer synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mammalian stem cell factor (SCF) cDNA oligonucleotide primer 220-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stem cell factor; progenitor; haematopoiesis; SCF; anaemia; thrombocytopenia; leucopenia; AIDS; immunodeficiency; bone graft; transplant; neoplasia; myelosuppression; bone marrow; ss.

```
AAT04915-T04922 are oligonucleotide primers and probes used for the amplification and sequencing of mammalian stem cell factor (SCF). Non-maturally occuring SCF and of-terminally truncated polypeptides, having amino acid sequences sufficiently duplicative of naturally ocurring SCF, stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The perides can be used in a composition for treating leucopenia, anaemia or thrombocytopenia, for enhancing engraftement of bone marrow during transplantation or for bone marrow recovery after chemotherapy or cadiation-induced bone marrow aplasia or myelosuppression. They can also be used for treating neoplasia, nerve damage, infertility, intestinal damage or myeloproliferative disorders. Antibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF may be useful for the treatment of AIDS and severe combined immunodeficiency (SCID) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotides having a partial sequence consisting of at least 15 bases of AAT63641 (an antisense oligo complementary to a region of the tax gene which can inhibit human T-cell lymphotropic virus type 1 (HTIV-1) viral antigen expression) are claimed. In an example, six antisense oligos were designed, T1-T6 (AAT63650-55) and were compared to six oligos derived from other regions of HTIV-1, i.e. SJ1 (splice junction), P1 (p21), R1 (rex), RR1 (rex response element), B1 (env) and G1 (gag), four reference oligonucleotides TIS (tax-sense), HC (dC20), HT (dT20) (AAT63547-49) and a random 2 Omer (RAN) in a HTLV-1 virus antigen expression inhibiting test. Oligonucleotide T1 gave the best results
                        containing compounds. It comprises contacting the phosphorus-containing compound which a 1,2,4-dithiazolidine-2,5-dione compound or a 3-substituted-1,2,4-dithiazolin-5-one compound. The method is especially useful for incorporation of phosphorothioate linkages into biologically important molecules such as DNA, RNA and phosphopeptides. Molecules containing such linkages are useful e.g. as antisense compounds for inhibiting gene expression, as reagents for studying DNA-protein or RNA-protein interactions, or as catalytic RNA. The present sequence represents an oligonucleotide with phosphorothioate linkages prepared by the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti-HTLV-1 anti-sense oligo:nucleotide - is complementary to region of tax gene from human T-cell lymphotropic virus type 1 and inhibits viral antigen expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Mycobacterium vaccae polypeptides - used to develop products for use in detection, therapy and prevention of mycobacteria infections or as immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This oligonucleotide is used in the DNA cloning strategies of the Mycobacterium vaccae antigens. The invention provides M. vaccae polypeptides that comprise an immunogenic portion of a soluble M. vaccae antigen, or a variant, where the antigen induces an immune response in patients previously exposed to a mycobacterium. Such M. vaccae patients previously exposed to a mycobacterium. Such M. vaccae polypeptides can be used in methods for enhancing non-specific immune response. The methods and products can be used for the detection, treatment and prevention of infectious diseases caused by mycobacteria such as M. vaccae, M. avium or M. tuberculosis. The products also have the ability to induce cell proliferation and cytckine products also have interferon-gamma and interleukin-12 production) in T cells, NK cells, interferon-gamma and interleukin-12 production) in T cells, B cells, Gr use in vaccines or immunotherapy of infectious diseases and cancers

```
Amixture of oligonucleotides (AAT86604-7) were separated by a new process using capillary affinity gel electrophoresis. The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer gel. Receptors for target molecules are covalantly bound to the polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the target molecules in the mixture are bound to the receptors and the remaining components are eluted, optionally whilst coptionally in stages, so that the affinity of the target molecules are cluted and optionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of faraged organic compounds, such as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of antibiotors. The process achieves higher resolution and selectivity than prior art processes, especially in the case of complex biological multitudes. The derivatised polymers may be synthesised specifically using standard methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                internation retailed to allyloxymethyl halides (II). (I) are internation retailed to a solivy procected to a solivy the solivy procected to a solivy oxymethyl halides (II). (I) are intermediates for synthesis of RNA-oligonucleotides with predetermined nucleotide sequence, particularly by machine synthesis. The groups of specified above, apart from those on silyl, are those particularly for products in diagnosis, therapy, and as research tools, are well known, and are not dealt with in detail. (II) is an intermediate for (I). The silyloxymethyl halide reagent is easy to prepare, and yields are high. Incroduction of the silyloxymethyl group into the ribonucleoside is simple and rapid, and the acetal bond formed does not migrate, climinating particularly the prior art problem of 2' to 3' isomerisation. The methylenedioxy group spacer between the silyl group and nucleoside ring results in less steric hindrance than bulky direct silyloxy (I) in an analying first, a range of choices for the silyl substituents, to provide, e.g., acid or base stability; and second, higher yields in coupling Purer products are therefore obtained than in prior art, the coupling Purer products and longer chains of oligoribonucleotides to be a constituted of the coupling in the product of the coupling in the coupling is and longer chains of oligoribonucleotides to be considered to the coupling in the coupling in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                             2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have high purity, use in machine synthesis of ribonucleic acids, enable longer oligonucleotide chain construction, and larger amounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invention relates to silyloxymethyl protected D- or L-ribonucleosides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mycobacterium vaccae protein, antigen; T cell activation; cytokine; dendritic cell maturation; infectious disease; immune disorder; cancer;

Pharmaceutical compositions comprising the proteins or nucleic acid beareaceutical compositions can be used for the treatment, prevention, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis, leprosy, sarcoidosis and lung cancers, and disorders of the skin such as psoriasis, atopic dermatitis, eczema, allergic contact dermatitis, allopecia areata, and skin cancers such as basal carcinoma, squamous cell carcinoma and melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides heat-killed Mycobacterium vaccae, or recombinant M. vaccae proteins may be employed to activate T cells and natural killer cells, to stimulate the production of cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention describes a novel method for quantitatively analysing a biochemical compound (I) which comprises contacting (I) with double atranded DNA fixed to the surface of an electrode at their terminals in which electrochemically active threading intercalators are intercalated, in an aqueous medium under application of electric potential to the clectrode in the presence of an oxidase which oxidizes the biochemical compound and becomes reduced, and detecting electric current flowing between the electrode and second electrode in the aqueous medium. The method is useful for detection of biochemical compounds such as plucose, cholesterol, urea nitrogen, bilirubin, uric acid, heameglobin and lactic acid in body fluids such as whole blood, plasma, serum, urine, and lymph for diagnosis of various diseases. The method allows detection of biochemical compounds quickly and easily with a high sensitivity using a simple apparatus. This sequence represents DNA fragment used as fixed probe DNA in the method of the invention
                                                                                                                                                                                                 Quantitative analysis of a biochemical compound such as glucose, in body a body fluid such as blood, comprising detecting enhanced electron transfer between an oxidase and a DNA-immobilized electrode, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stem cell factor; SCF; haematopoietic progenitor cell; blood forming; primitive progenitor cell; haematopoietic disorder; syngensic; allogeneic; autologous bone marrow marnsplant; gene therapy; transfection; haematopoietic stem cell; acute blood loss; neoplasia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for quantitatively analysing a biochemical compound (1) which comprises contacting (1) with double stranded DNA fixed to the surface of an electrode at their terminals in which electrochemically active threading intercalators are intercalated, in an aqueous medium under application of electric potential to the electrode in the presence of an oxidase which oxidizes the biochemical compound and becomes reduced, and detecting electric current flowing between the electrode and a second electrode in the aqueous medium. The method is useful for detection of biochemical compounds such as glucose, cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic acid in body fluids such as whole blood, plasma, serum, urine, and lymph for diagnosis of various diseases. The method allows detection of biochemical compounds quickly and easily with a high sensitivity using a biochemical compounds.
                                                                                                                                                                                                                                                                                                                                                                       Quantitative analysis of a biochemical compound such as glucose, in body a body fluid such as blood, comprising detecting enhanced electron transfer between an oxidase and a DNA-immobilized electrode, useful for diagnosis of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     . Production of hematopoietic cells suitable for administration to a subject using progenitor cells and expanding the cells using stem cell WPI; 2000-259135/23 (AMGE-) AMGEN INC. Zsebo KM, 

```
Amethod has been developed of making haematopoietic cells suitable for administration to a subject. The method comprises: (a) obtaining cadministration to a subject. The method comprises: (a) obtaining to administration to a subject. The method comprises: (a) obtaining to be adding to the cells a haematopoietically effective dose of a polypeptide product having at least part of the primary structural confirmation and one or more of the biological properties of naturally occurring stem cell factor (SCF). The method is useful for stimulating primitive progenitor cells including early haematopoietic progenitor cells including early haematopoietic progenitor cells including early haematopoietic cells of both myeloid and lymphoid lineages. Increases in haematopoietic cells of both myeloid and lymphoid lineages. Cor expanding early haematopoietic progenitors in syngeneic, allogeneic cells of cor autologous bone marrow transplant. SCF is useful for enhancing the cells. Cor autologous bone marrow transplant. SCF is useful for enhancing the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery cafter acute blood loss and as a boost to the immune system for fighting continuous and continuous continuous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligonucleotide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 1 A; 0 C; 1 G; 18 T; 0 U; 0 Other;

Suggs SV,

derivatives. The new compounds may be used directly or indirectly in the development of new diagnostic tests, to follow infections, especially viral infections, to follow and/or measure chemical products, especially potential pollutants. In diagnostic tests they may be used as markers, or to form a universal solid phase after immobilization on a solid support, to produce monoclonal antibodies or polyclonal antibodies having diagnostic uses. The oligomuclectides AAZ91113-Z91117 represent examples of sequences that can be labeled with the new abietane derivatives. The but because they are not found naturally in humans the risk of potential interactions with biological molecules is eliminated The invention relates to novel saturated and unsaturated abietane

Preparation of mixed backbone oligomeric compounds useful as e.g. primers for diagnostic tests, involves oxidation of H-phosphonate internucleoside linkages to phosphodiester internucleoside linkages.

Example 12; Page 34; 49pp; English.

The present sequence is that of a phosphodiester oligonucleotide containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group on its 5' ribosyl sugar moiety. It is an example of an oligomeric compound produced according to the methods of the invention. The invention provides

compounds and methods for the preparation of mixed backbone oligomeric, addition to phosphoratioate and/or phosphoramidate internucleoside linkages in linkages. The methods also include incorporation of boranophosphate internucleoside linkages. The methods utilise H-phosphonate intermediates internucleoside linkages. The methods utilise H-phosphonate intermediates phosphonate internucleoside linkages. Each contiguous regions of 1 or more H-phosphonate internucleoside linkages. Each contiguous region is subsequently oxidized to phosphodiester, phosphorothicate, phosphoromidate or boranophosphate internucleoside linkages prior to this phosphoromidate or boranophosphate internucleoside linkages prior to this phosphoremic are prepared in the internucleoside linkages prior to this phosphoremic phosphoremic phosphoremic phosphate internucleoside linkages prior to this phosphoremic p
                                                                                                                                                                                                                                                                         this manner by oxidizing adjacent regions with different reagents.

Oligomeric compounds of the invention are prepared using novel oxidation steps that oxidize a region of 1 or more H-phosphonate internucleoside linkages without degrading existing linkages that have been previously pxobes, The oligonucleotides obtained are useful as primers in PCR, probes, linkers, gene fragments and for other diagnostic tests on e.g. biological tissue, fluid, cells etc., as research reagents, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunostimulatory oligodeoxynucleotide; immunostimulatory ODN; immunostimulatory DNA-binding protein; nucleolin; hnRNP D; AUF1; hnRNP AI, lupus La protein; functional modifier identification; agonist; antagonist; mim.c; inhibitor; drug screening; cellular target identification; oligonucleotide optimisation;

Oligodeoxynucleotide (ODM) activity. Such modifiers of ODM activity consist of immunostimulatory DNA binding inhibitors, immunostimulatory DNA binding inhibitors, immunostimulatory DNA agonists and antagonists.

Immunostimulatory DNA-binding proteins can also be used in screening methods to identify immunostimulatory DNA binding competitors, and to optimize an immunostimulatory ODM for immune stimulation. Isolated complexes of an immunostimulatory DNA-binding protein bound to an immunostimulatory ODN can additionally be used to screen a panel of candidate target molecules to identify the cellular target molecules of the immunostimulatory DNN-binding proteins used in the methods of the invention are the RNM-binding proteins cublewen immunostimulatory DNA and an immunostimulatory DNA-binding proteins methods are useful for identifying a compound that inhibits interaction between immunostimulatory DNA and an immunostimulatory DNA-binding complex is useful in screening consists useful in immunotherapy. The complex is useful in screening to identifying agonists useful in immunotherapy. The complex is useful in screening consisting immunostimulatory DNA cellular target molecules. The candidate immunostimulatory DNA cellular target consisting immunostimulatory DNA cellular target consisting immunostimulatory consisting and for identifying activity relationships of immunostimulatory consisting immunostimulatory consisting

The sequence represents a synthetic DNA template molecule used to demonstrate the method of the invention. The invention relates to a method of modifying (e.g. 3' end labelling with 32P dATP) the 3' terminus of an RNA molecule by providing a DNA oligonucleotide, complimentary to the 3' end of the RNA molecule, with an overhang at the 5' end which allows incorporation of the labelling nucleotide into the RNA molecule. The method, based on the synthesis of Okazaki fragments, is useful for Tabeling and modifying the 3'-termini of other nucleic acids such as DNA fragments. The method is a simple and efficient way of labelling or modifying RNA 3'-termini using DNA polymerase and a synthetic template with defined overhang nucleotides

Fibronectin scaffold protein array for obtaining a protein/compound which binds to a compound/protein, comprises a fibronectin type III domain having a randomized loop, a randomized beta-sheet or their combination. Disclosure; Page 41; 67pp; English.

The present invention relates to an array of proteins (antibody mimics) comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally-occurring tibronectin, immobilised onto a solid support. The antibody mimics is useful for detecring a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is a capture probe used to self-assemble and anchor the tenth module of human

New substituted aryl conjugates of parent molecules, especially oligonuclectides, having improved transmembrane and intracellular transport properties, useful as medicaments or diagnostic agents.

Disclosure; Page 9; 28pp; German.

This invention describes a novel conjugate (I) which consists of (A) a molecule to be transported and (B) at least one aryl residue of formula - CC molecule to be transported and (B) at least one aryl residue of formula - CC Ar-(K-CY)-R I) n (II). Ar = group containing at least one aromatic ring; CX = O or N (Bic); Y = O, SO NH-R\_2 (Bic); R I = optionally substituted containing double and/or triple bonds); R\_2 = optionally substituted 1.18C alkyl (optionally containing double and/or criple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or criple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or criple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or criple bonds; n = integer of 1 or more. (A) is bonded to (B) at least one aryl residue (not restricted to compercial so (i) the preparation of a conjugate (I) of (A) a molecule to be transported and (B) at least one aryl residue (not restricted to compercial (B) is to be bonded, preparing (B) and reacting (A) and (B); at which (B) is to be bonded, preparing (B) and reacting (A) and (B); cand (ii) the use of aryl groups (II) (optionally bonded via a chemical group) for transporting (A) across biological membranes. The products of the invention have cytostatic, virucide, vasotropic, dermatological, carriage functionally bacterial, yeast or mammalian cells, including human cells, cyparticularly tumor cells). Medicaments, diagnostic agents and test kits containing (I) are also claimed. Typically (I) are antisense

```
cell interactions (e.g. restencess, vitiligo, psoriasis or asthma); or labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ bybridization. Conjugation with (B) markedly improves the cellular uptake of (A), e.g. in tumor cells. (B) include fluorescein derivative residues, in which case the conjugates (I) are fluorescently labeled, allowing microscopic monitoring of cellular uptake etc. The cellular uptake of (I) is superior to that obtained using other conjugated groups related (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within the scope of (B)) have superior uptake to corresponding fluorescein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide-nanoparticle probe, diagnostic, forensic analysis, nucleic acid detection, nanostructure, biochip, biofilter, drug delivery,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         having at least 2 portions, comprising treatment with nanoparticles that carry oligonucleotides complementary to at least 2 parts of [1], where detectable change caused by hybridisation of the oligonucleotide to [1] is observed. The method is used to detect (or to separate) specific [1], e.g. for diagnosing a wide variety of diseases, sequencing, in forensic
treating viral infections or diseases associated with integrins or cell-
                                                                                                                                                                                                                                                                         Gape

The invention relates to a method for enrichment of natural antisense messenger RNA. This method involves generating a population of CDNA from mRNA, incubating the generated CDNA to produce double stranded hybrid DNA molecules consisting of sense and antisense CDNA, treating the hybrid colecules using DNA polymerase with an exonuclease activity, amplifying the double stranded molecule using a deoxythymidine (dT) primer and cloning the amplified double stranded molecule. This method is useful for enrichment of natural antisense mRNA from any natural source of RNA. It is used to detect whether mRNAs have a natural anti-sense counterpart. The method provides a basis for finding new genes with important cellular cyclular provides a transfal for development of an antisense-based provides a starting material for development of an antisense-based the sense gene or transcript is involved. The present sequence is KU\_REV analysis etc., and generally to detect analytes other than (I). The oligonucleotide-derivatised nanoparticles are also useful for preparing nanostructures useful, for example, as biochips, biofilters, mechanical devices, separation membranes, chemical sensors, in computers, and for drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be produced, allowing their direct use (as probes) in polymerase chain reaction, i.e. they survive multiple heating/cooling cycles so do not need to be added after amplification. (I) are detected by simple colour change, without the need for special equipment, making possible rapid field testing for e.g. pathogens. Assi314-AAS65448 represent oligonucleotide-nanoparticle probes, and related sequences, used in the Enrichment and detection of natural antisense mRNA comprises generating double stranded hybrid cDNA using a polymerase with an exonuclease activity, amplifying using a DT primer and cloning. The method comprises thybridising the nucleic acid with oligonuclectides, such as the present sequence, attached to a substrate and/or particle and detecting a change in colour, conductivity or optical density. The method is useful for the diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication and for monitoring gene therapy. Detecting nucleic acids based upon observing a colour change is cheap, fast, simple, and does not require specialised or expensive equipment. The nanoparticle oligonucleotide conjugates remain stable for at least 6 months. A single base mismatch and as little as 20 femtomoles (fM) of target can be detected using the conjugates
reverse transcription PCR (RT-PCR) primer used for amplifying human ku autoantigen sequence. This primer is used in endogenous antisense identification (EASI) procedure for enrichment of natural antisense mRNA

```
The sequence represents a cyclic disulphide linked oligonucleotide which may be coupled with colloidal gold particles (nanoparticles) and used to demonstrate the method of the invention. The invention relates to isolating or detecting a nucleic acid of interest, in a mixture of nucleic acids, by binding it to 2 or more complimentary nucleotides which nucleic acids, by binding it to 2 or more complimentary nucleotides which have a nanoparticle attached to their 5' ends. The nanoparticles (e.g. colloidal gold) are used to both isolate and detect (e.g. by linking the particle to a fluorescent probe) the resultant complex. The methods are useful for detecting nucleic acids, natural or synthetic, and modified or unmodified. The methods may also be applied in the disagnosis of genetic, bacterial and viral diseases, in forenaics, in DNA sequencing, for cell line authentication, and for monitoring gene therapy. The methods are further useful in research and analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, for quick identification of an infection to assist in drug prescription, and in homes and health centres for inexpensive first-

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunose. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, chaemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is slowered also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a that to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothicate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid can be pyrimidated (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia acid and/or staphylococus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a first to a Thi immune received to activate immune cells. Note: the

Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB89351 to AAB89390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mammalian cell in vitro, involves exposing cell that expresses a stem
cell factor receptor to stem cell factor, and introducing polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                        The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain enzymas which recognise nucleic acids
                                                                                                                                                                                                                 Preparing sulfurized 2' substituted phosphorothioate oligonucleotides useful in biological research, comprises phosphitylating the 5'-hydroxyl of a nucleic acid having a nucleoside with a 2' modification.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for identifying a nucleic acid in a pool of interest. The method comprises pooling individually identifiable nucleic acids into at least two pools of one nucleic acid acch; expressing nucleic acid pools to obtain protein expression product pools; assaying protein expression product pools; with target molecule; selecting nucleic acid pools corresponding to identified protein expression product pools; and identifying individual nucleic acids in identified nucleic acid pools. The method is useful for identifying a nucleic acid (e.g. cDNA) in a pool of interest and for functionally screening several nucleic acids. The method is useful for serverening genomic DNA libraries or other source of individual cDNAs, manna, synthetic libraries of nucleic acids e.g. combinatorial libraries. The present sequence was used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in antisense therapy, by synthesizing oligonucleotides comprising backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Deoxynucleic S-Methythiourea; DNmt; antisense therapy; cardiovascular disease; inflammatory disease; neurocellular disease; antiviral therapy; human immunodeficiency virus; human-cytomegalovirus; influenza; herpes; infection; 88.
                                                                                                                                                                                               Screening nucleic acids (NA) in pool of interest comprises pooling, expressing NA to form expression product pool and identifying NA in NA pool corresponding to expression product pool having interaction with target moiety.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.7%; Score 20; DB 1; Length 20;

The present sequence was used to demonstrate the ability of deoxynucleic S-Methythiourea (DNmt) compounds to form triplexes with DNA oligomers. An increase in the C content of the oligos resulted in a large decrease in the C content of the oligos resulted in a large decrease in binding. This experiment was performed as an example of a method for preparing oligonucleotides comprising a backbone of alkyl or alkoxy comprising on a performed in second to a large therapy, to inhibit production of proteins associated with genetic diseases, cardiovascular, inflammatory and neurocellular diseases, and for antiviral therapy, e.g. to treat comman immunodeficiency virus, human-cytomegalovirus, influenza and herpes infections. The compounds are also useful as diagnostic reagents to detect the presence or absence of the target DNA or RNA sequences to detect the presence or absence of the target DNA or RNA sequences to activity of a target protein, they can be used in the manipulation of activity of a target protein, they can be used in the manipulation of clissue e.g. tissue differentiation, both in vivo and in ex vivo tissue cultures. The method provides an efficient and rapid solid-phase method control of the the synthesis of thiourea and S-methylthiourea or alkoxy thiourea linkages in solution or on solid phase. Example 7; Fig 16; 48pp; English. of alkyl

Novel nucleic acids encoding stem cell factor useful for treating disorders involving blood cells, e.g. leukemia, splenomegaly, Hodgkin's

```
The present sequence for universal PCR primer 220-7 is 1 of 8 universal oligomucleotides (AAS04110-AAS04117) used in the isolation of the human SCF (stem cell factor) DNNA sequence. The present invention relates to novel stem cell factors (AAU02453-AAU02466, AAU02461) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells concluding early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02462-AAU02481) and the oligonucleotides (AAS04081-AAS04117) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for tracting disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple compestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminting septicemia, malaria, vitamin B12 and folic acid deficiency, principanta deficiency, and hypopigmentation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Example 1; Page 63; 67pp; Japanese.

The present invention describes a method of amplifying nucleic acids, involving forming a single-stranded DNA to an mRNA in a sample with a primer, synthesising a DNA strand complementary to the single-stranded DNA to form a double-stranded DNA, adding a single or double-stranded adapter DNA to the double-stranded DNA, and amplifying the DNA strand using a second primer with a nucleic acid sequence in the adapter DNA.

These are capable of stimulating the growth of early haemacopoietic progenitor cells, neural stem cells and primordial garm stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention
This can be used to amplify nucleic acids to monitor mRNA expression, which is applicable in producing e.g. cRNA libraries, cDNA libraries, DNA introservays or membrane arrays in gene engineering and gene expression analysis, and in drug development and health maintenance and management. The present sequence is a PCR primer described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar, sarcoidosis.
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; rat; mammal; stem cell factor; SCF; cell growth stimulation; gene therapy; haematopoietic disorder; aplastic anaemia; leukaemia; neurological damage; intestinal damage; infertility; AIDS; SCID; severe combined immunodeficiency; PCR primer; ss.

The present sequence for universal PCR primer 220-7 is 1 of 8 universal oligonucleotides (AAH23888-AAH23895) used in the isolation of the human oligonucleotides (AAH23888-AAH23895) used in the isolation of the human SC SCF (setem cell factor) cDNA sequence. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73575) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73889-AAB73887) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene herapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Rala azar, sarcoidosis, military tuberculosis, congestive splenomegaly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                        The present sequence for universal PCR primer 220-7 is 1 of 8 universal oligonucleotides (AAS04211-AAS04218) used in the isolation of the human SCF (stem cell factor) CDNA sequence. The present invention relates to novel stem cell factors (AAU02761-AAU02767, AAU02775-AAU02775, AAU02775) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the oligonucleotides.

(AAS04182-AAS04210) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in the isolation of human, and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in the isolation of human, acute leukaemia, multiple such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive sphenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation construction as piebaldism and vitiligo
                                                                                                                                                                                                                                                                     Human, stem cell factor, SCF, early haematopoietic progenitor cell,
blood disorder, leukaemia, Hodgkin's disease, lymphoma, splenomegal,
anaemia, Kala azar, septicemia, malaria, hypopigmentation disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated DNA sequence, encoding polypeptide product useful for stimulating growth of early hematopoietic progenitor cells.
                                                                                                                                                                                                                                   Human SCF (stem cell factor) cDNA universal PCR primer 220-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 1 A; 0 C; 1 G; 18 T; 0 U; 0 Other;

The present sequence for universal PCR primer 220-7 is 1 of 19 PCR primers (AAS10435-AAS10453) used to amplify various portions of the human SCF CDNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodkin's disease, a disease, leading myelofibrosis, viemnn-Pick disease, refractory anaemia, malaria, vitamin B12 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lession, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and

```

administering at least one antifaring instructions and molecule. Also included is a kit comprising a first container housing them to a subject nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Obler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, naemophilac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic

acid of the invention

Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangaectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to methods for treating or preventing developing administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, brain and central nervous system (CNS) cancer, brasse cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, elung cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, pancreatic cancer, plodgkin's lymphoma, melanoma, mycloma, oral carity cancer, over an earlier, orancer, cancer, testicular cancer, ribabdomyosarcoma, skin cancer, testicular cancer, and uterine cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for detecting 1 base polymorphism on the sequence of a chromosome or its fragment in which a sample nucleic acid is reacted with a reaction liquor containing a nucleic acid primer having a base adjacent to the polymorphic base at its 3'-end, one didecoxynuclectide corresponding to a polymorphic base having a distinguishable feature or its mixture, DNA polymerase and a composition required for its activity expression to detect the presence of taking dideoxynucleotide in the nucleic acid primer and to detect the type of the base to be specified. The method is used for detecting 1 base polymorphism on the sequence of a chromosome or its fragment. The present sequence is that of a PCR primer, useful in examples of the invention
treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, cesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, stomach cancer, prostete cancer, rhaddomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                Gaps

Detecting nucleic acid, useful for diagnosis of genetic, viral or bacterial disease, comprises hybridizing nanoparticles with attached oligonucleotides to nucleic acid and detecting change brought about by hybridization.

Example 18; Page 410; 412pp; English.

The invention relates to a method of detecting a nucleic acid (NA) having at least 2 portions comprising: (a) providing nanoparticles (NP) with at least 2 portions comprising: (a) providing nanoparticles (NP) with a trached oligonuclecides (OGN), where OGN has a sequence complementary to the sequence of NA; (b) contacting NP under conditions

CC effective to allow hybridisation of OGN with NA; and (c) observing a detectable change brought about by hybridisation of OGN with NA. The method is useful for detecting a nucleic acid separating a selected on uncleic acid from others and methods of nanofabrication. Detecting analytes such as nucleic acids and proteins are useful for the diagnosis of generic, bacterial and viral diseases. The OGN-NP conjugates that use cyclic disulphide linkers improve the sensitivity of diagnostic assays.

CC polic disulphide linkers improve the sensitivity of diagnostic assays.

CC plud to be approximately 10 times more sensitivity than assays employing comprising a steroid astached to a cyclic disulphide have been found to be approximately 10 times more sensitive than assays employing conjugates prepared using alkanethiols or acyclic disulphides as the directly in PCR solutions. Therefore conjugates added as probes to a DNA carried through the 30 or 40 heating coling cycles of the PCR and are still able to detect the amplicons without opening the tubes and causing contamination. ABK64981-ABK65055 represent nanoparticle-oligonucleotides of the invention

Detecting nucleic acid, useful for diagnosis of genetic, viral or bacterial disease, comprises hybridizing nanoparticles with attached oligonuclectides to nucleic acid and detecting change brought about hybridization.

Example 24; Fig 44; 412pp; English.

The invention relates to a method of detecting a nucleic acid (NA) having at least 2 portions comprising: (a) providing nanoparticles (NP) with at least 2 portions comprising: (a) providing nanoparticles (NP) with a tatached oligonuclectides (OGN), where OGN has a sequence complementary to the sequence of NA; (b) contacting NA and NP under conditions ceffective to allow hybridisation of GON with NA. The detectable change brought about by hybridisation of OGN with NA. The detectable change brought about by hybridisation of OGN with NA. The conclet acid from others and methods of nanofabrication. Detecting analytes such as nucleic acids and proteins are useful for the diagnosis of genetic, bacterial and viral diseases. The OGN-NP conjugates that use cyclic disulphide linkers improve the sensitivity of diagnostic assays.

In particular assays using OGN-NP conjugates prepared using linkers of omprising a steroid residue attached to a cyclic disulphide have been found to be approximately 10 times more sensitivity than assays employing comprising a steroid residue attached to a cyclic disulphides as the directly in PCR solutions. These more sensitive than assays employing conjugates prepared using alkanethiols or acyclic disulphides as the directly in PCR solutions. Therefore conjugates and as probase to a DNA target to be PCR amplified can be carried through the 30 or 40 heating colling cycles of the PCR and are still able to detect the amplicons without opening the tubes and causing contamination. Novel non-naturally-occurring stem cell factor polypeptide, useful for treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.

Example 3; Fig 12C; 217pp; English.

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently duplicative of that of naturally-occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopeenia, thrombocytopaenia, anemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal damage in a mammal. SCF sequences are useful for proparing biologically active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of early active polymer polypeptide adduct, for enhancing transfection of agene into a mammal. They are useful for treating myelofibrosis, myeloscapetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, cletterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary splenic pancytopaenia, disseminated fungus disease, malaria, military

pyridoxine deficiency, vitamin B12 tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin Bliand folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation disorders such as piebaldism, AIDS (acquired immune deficiency syndrome) and vitiligo. The present sequence is a PCR primer which is used for amplifying the 5' and of rat SCF CDNA. This sequence is used in the exemplification of the invention

Production of a human stem cell factor (SCF) polypeptide for treating disorders involving blood cells, such as leukemia, comprises culturing mammalian cells comprising non-human SCF promoter DNA linked to DNA encoding the human SCF

Example 3; Fig 12C; 120pp; English.

The present invention relates to novel stem cell factors (SCFs), polynucleotide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence representing a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of inhibiting skin inflammation associated with a skin disorder selected from psoriasis, atopic dermatitis, and allergic contact dermatitis, which involves administering a composition containing delipidated and deglycolipidated Mycobacterium vaccae cells or M. vaccae culture filtrate. The skin disorder to be treated may also include alopecia areata, and skin cancers such as basal cell carcinoma, squamous cell carcinoma and melanoma. The composition acts by inhibiting the Th2 immune response. The present sequence is a probe described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid detection method; nanoparticle-oligonucleotide conjugate; nanoparticle; viral RNA detection; bacterial DNA detection; fungal DNA detection; nanoprobe conjugate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of detecting (M1) a nucleic acid having two portions, involving providing nanoparticles having oligonucleotides attached to it, which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and nanoparticles, to allow hybridisation of oligonucleotides with two or more portions of nucleic acid, and observing a detectable change brought about by hybridisation. (M1) nanoparticles (1), nanoparticle oligonucleotide conjugates (II) and the aggregate probe are useful for detecting two or more nucleic acids (from a biological source) having at least two or more nucleic acids (from a biological source) having at least two or portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic with a disease, synthetic, or structurally-modified natural or synthetic (II) is useful for preparing a nanoprobe conjugate for detecting an analyte, and for detecting an analyte, and for detecting an encleic acid having two portions from other nucleic acids. (I), (II) and the are useful for detecting an analyte (especially analyte) and an analyte (especially analyte).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                      Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid detection method; nanoparticle-oligonucleotide conjugate; nanoparticle; viral RNA detection; bacterial DNA detection;

The invention describes a method of detecting (M1) a nucleic acid having two portions, involving providing nanoparticles having oligonucleotides attached to it, which has a sequence complementary to sequence of two cortions of nucleic acid, contacting nucleic acid and nanoparticles, to allow hybridisation of oligonucleotides with two or more portions of nucleic acid, and observing a detectable change brought about by hybridisation. (M1), nanoparticles (1), nanoparticle oligonucleotide hybridisation. (M1), nanoparticles (1), nanoparticle-oligonucleotide conjugates (II) and the aggregate probe are useful for detecting two or more nucleic acid (from a biological source) having at least two cortions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. (II) is useful for preparing a nanoprobe conjugate for detecting an analyte, and for detecting an nucleic acid having two portions from other nucleic acids. (I), (II) and conjugate probe are useful for debatication, and for separating a salected conjugate probe are useful for describing an analyte (especially conjugate), in a sample of the separating an analyte (especially conjugate).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in a sample. This sequence represents a to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Elghanian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 20; DB 1; Length 20;

The present invention describes a non-antibody protein, comprising a domain having an immunoglobulin-like fold, derived from a reference brotein having a mutated amino acid sequence, where the non-antibody protein brinds with a Kd at least as tight as 10 nM to a compound that is not bound as tightly by the reference protein. The non-antibody protein is useful as scaffcilds for selecting or designing a protein framework with specific and favourable properties, e.g. for binding any antigen of interest, or for destroying or inactivating antibody molecules. The non-antibody protein is also useful in all areas where antibodies are used, e.g. research, therapeutic or diagnostic fields, and for screening novel binding proteins useful in the above-mentioned fields. The present proteins have thermodynamic properties superior to those of natural antibody mimics exhibit improved biophysical properties, such as antibody mimics exhibit improved biophysical properties. Such as concentrations. In addition, these molecules are readily expressed and folded in prokaryotic systems (e.g. yeast), or in in vitro translation systems (e.g. rebabit reticulocyte lysate system). Furthermore, these proteins are extremely amenable to affinity maturation techniques involving multiple cycles of selection, e.g. in vitro selection using RNA-protein fusion technology, phage display or yeast display systems. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                 New non-antibody proteins having an immunoglobulin fold, useful in research, therapeutic or diagnostic fields, particularly as scaffolds for designing proteins with specific properties, e.g. for binding any antigen

```
The invention relates to a method of detecting a nucleic acid having two portions. The method involves providing nanoparticles having to oligonucleotides attached to it which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and nanoparticles to allow hybridisation of oligonucleotides with two or more portions of nucleic acid and observing a detectable change brought about by hybridisation. The method and aggrague probes are useful for detecting two or more nucleic acids (from a biological source) having at least two portions such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic or structurally modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. The invention is useful for preparing a nanoprobe conjugate for detecting an analyte and for detecting a nucleic acid bound to an electrode surface. It is also useful for fabrication and for separating a selected nucleic acid having two portions from other nucleic acids. The present sequence is an oligo used to illustrate the method of
                                                                                                                                                                                                                                                                                                                Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change.

                                                                                                                                                                                                                                                                     The invention relates to DNA sequences (I) that encode six specific plant proteins: (i) a protein (ABP60425) with mitochondrial carrier protein activity (IIa); (ii) a protein (ABP60426) with transferrin binding protein activity (IIb); (iii) a protein (ABP60427) with receptor-like protein kinase activity (IId); (v) a protein (ABP60429) with helongation factor EF-2 activity (IId); (v) a protein (ABP60429) with helongation factor EF-2 activity (IId); (v) a protein (ABP60429) with non-long creminal repeat retroelement reverse transcriptase activity (IIe); or (vi) a protein (ABP60429) with helicase activity (IIf); (I), also related sequences, derived ribozymes and antisense sequences, expression vectors, encoded proteins and antibodies against the proteins are used to produce plants with altered properties, including tolerance of overwatering. The antibodies are also used for isolation of the proteins and in immunoassays. Also (I) or their primer or probe fragments are used to screen for terminators and constitutively, aerobically or anaerobically inducible plant promoters, specifically for use in potatoes and the sequence that encodes (IId) is used to alter the translation profile in plants or since (I) are derived from potato, their promoters and the control endogenous genes. The present sequence is that of a PKR primer control endogenous genes. The present sequence is that of a PKR primer control or and a primer of the present sequence is that of a PKR primer control or and a primer of the present sequence is that of a pKR primer control or and a primer or a probe of the present sequence is that of a pKR primer control or and a primer or a probe of the present sequence is that of a primer or and a primer or and a primer or a primer or and a prime
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                      New DNA sequences from potato, useful for producing plants with altered properties, e.g. tolerance of flooding, also related proteins, antibodies and inhibitory sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nanoparticle; 88; nucleic acid detection; viral disease; probe; human immunodeficiency virus infection; hepatitis virus infection; herpes virus infection; cycomegalovirus infection; forensic science; Epstein-Barr virus infection; bacterial disease; gene therapy; escually transmitted disease; inherited disease; pNs sequencing; paternity testing; cell line authentication.

The invention relates to detecting a nucleic acid (NA) having at least 2 portions, comprises providing a type of nanoparticles (NP) having attached to oligonuclectides (O) ((0) on each NP has a sequence complementary to sequence of at least 2 portions of NA), contacting NA and NP to allow hybridisation of (0) on NP with Contacting NA, contacting a detectable change brought about by hybridisation of (0) on NP with NA. The nanoparticle is useful for separating a selected nucleic acid having at least 2 portions, from other nucleic acids, and for detecting nucleic acids having at least 2 portions. The method of cusing NP is useful for detecting any type of nucleic acids which may be cusing NP is useful for detecting nucleic acids of nucleic acids of preferably, the method is useful for detecting nucleic acids for diagnosis and/or monitoring of viral diseases (human immunodeficiency virus), hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually transmitted diseases, inherited diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication and for monitoring gene therapy. The method is useful in research and analytical laboratories in DNA sequencing and in the field to detect the presence of specific pathogens. Detecting nucleic acids based on observing a colour change with the maked eye is cheap, calse, simple and robust, and do not require specialised expensive equipment. The present sequence is a nanoparticle (e.g. gold particles)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nonoparticle; nucleic acid detection; hybridisation; diagnosis; sequencing; viral infection; human immunodeficiency virus; HIV; hepatitis virus; herpes virus; cytomegalovirus; Epstein-Barr virus; bacterial infection; sexually transmitted disease; inherited disorder; forensic; paternity testing; cell line authentication; gene therapy; 68.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting nucleic acids having at least 2 portions comprises use of nanoparticles which have oligonucleotides attached to them that are complementary to portions of the nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                        Elghanian R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

This invention describes a novel method of detecting nucleic acid having at least two portions. The method involves providing nanoparticles attached to oligonucleotides, where the oligonucleotide on each nanoparticle have a sequence complementary to a sequence of at least two portions of nucleic acid, contacting nucleic acid and nanoparticle with two complements acid. The method is useful for separating a detectable change brought about by hybridisation of the oligonucleotide nanoparticle with two or more portions of nucleic acid and observing a selected nucleic acid having at least two portions, from other nucleic acids and for detecting nucleic acids having at least two portions. The method is useful for detecting any type of nucleic acids which may be used for diagnosis of disease and in sequencing of nucleic acids. Preferably, the method is useful for detecting any type of nucleic acids for diagnosis and/or monitoring of viral infections (human immunodeficiency virus (HIV), hepatitis virus, there is virus, cytomegalovirus and Epstein-Barr virus), bacterial chiesease, in DNA sequencing, for paternity testing, for cell line concensics, in DNA sequencing, for paternity testing, for cell line casearch and analytical laboratories in DNA sequencing in the field to detect the presence of specific pathogens. Detecting nucleic acids based on observing a colour change with the naked eye is cheap, fast, simple and robust and does not require specialised expensive equipment. ABX92123 captod of the invention

ဌ Detecting nucleic acids having 2 portions e.g. for detecting disease, comprises use of nanoparticles which have oligonucleotides attached to them that are complementary to portions of the nucleic acid sequence.

Example 18; Page 43; 129pp; English.

This invention relates to a novel method for detecting a nucleic acid having 2 portions. The method comprises providing nanoparticles having 2 portions. The method comprises providing nanoparticles to algonucleotide on each nanoparticle has a sequence complementary to a sequence of 2 portions of nucleic acid and nanoparticle are contacted to allow hybridisation of the oligonucleotide on the nanoparticle with two or more portions of cut plopanicleotide on the nanoparticle with two or more portions of or nucleic acid and observing a detectable change brought about by the hybridisation. The method of the invention is useful for separating a content nucleic acids, and content nucleic acids having 2 portions. The method of the invention is useful for detecting any type of nucleic acids which may be used for disease and in sequencing of nucleic acids for disponsis and/or monitoring of viral diseases (human immunodeficiency virus, hepters virus, herpes virus, cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually transmitted disease, inherited diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication, for monitoring gene therapy, etc. This method involves detecting nucleic acids based on observing a colour change with the naked eye so is cheap, fast, simple and robust, and does not require content in a sequence represents a thiol specialised expensive equipment. The present sequence represents a thiol modified oligonucleotide sequence used to demonstrate the method of the invention

                                                                     RESULT 470
```

```
This invention relates to a novel method for detecting nucleic acid
sequences having two portions. The method involves providing
contentials having on oligonucleotides attached to them, which has a
sequence complementary to sequence of two portions of nucleic acid,
contacting nucleic acid and nanoparticles, to allow hybridisation of
contacting nucleic acid and nanoparticles, to allow hybridisation of
contacting nucleic acid and nanoparticles, to allow hybridisation of
a detectable change brought about by hybridisation. The method of the
contacting acids (from a biological source) having at least two portions,
such as viral RNA or DNA, bacterial or fungal DNA, a gene associated with
a disease, synthetic, or structurally modified natural or synthetic RNA
a disease, synthetic, or structurally modified natural or synthetic RNA
cor DNA, or a product of a polymerase chain reaction amplification.
Nanoparticles and nanoparticle oligonuclectide conjugates of the
invention are useful for nanofabrication, and for separating a selected
invention is useful in forensics, DNA sequencing, for paternity
ctesting, cell line authentication, and monitoring gene therapy.
Ctesting, call line authentication, and monitoring gene therapy.
Ctesting, call line authentication, and monitoring gene therapy.
Ctesting, call line authentication, and monitoring gene conjugates
Cf the invention improve the sensitivity of the nucleic acid detection
assay. The present sequence represents a thiol modified oligonucleotide
cross sequence used to demonstrate the method of the invention
                                                                                                                      Example 18; Page 44; 130pp; English.
useful in forensics.
```

```
This invention relates to a novel method for detecting a nucleic acid by contacting a nucleic acid with at least two types of nanoparticles having oligonucleotides attached, allowing hybridisation of the oligonucleotides content and observing a detectable change. The coligonucleotides on each nanoparticle have a sequence complementary to its respective portion of the sequence of the nucleic acid to be content of the invention may be used for the detection of a detected. The method of the invention may be used for the detection of a sequencing, in the field to detect the presence of specific pathogens, in the doctor's office for quick identification of an infection to assist in the correction of a nucleic acid used in, esquencing. The method of the invention detects in expensive first-line screening. The method of the invention detects nucleic acids based on observing a colour change with the naked eye. This cancel to the present sequence represents a thiol modified expensive equipment. The present sequence represents a thiol modified

                                                                                                                                                             ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel method for detecting a nucleic acid by contacting nucleic acid with at least two types of nanoparticles having contacting nucleic acid with at least two types of nanoparticles, allowing hybridisation of the oligonucleotides on the nanoparticles, and observing a detectable change. The oligonucleotides on the cach nanoparticle have a sequence complementary to its respective portion of the sequence of the nucleic acid. The method of the invention may be used for the detection of a nucleic acid used in, e.g. research and analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, in the doctor's office for quick consenting of an infection to assist in prescribing a drug for treatment, and in homes and health centres for inexpensive first-line screening. The inventive method of detecting nucleic acids based on observing a colour change with the naked eye are cheap, fast, simple, robust (the reagents are stable), do not require specialised or expensive
                                                                                               ö
 oligonucleotide sequence used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of nucleic acid for, e.g. research and analytical laboratories in deoxyribonucleic acid sequencing, involves contacting nucleic acid with nanoparticles having oligonucleotides.
                                                                                              Gaps

The method comprises providing nanoparticles with oligonucleotides attached to them, which have a sequence complementary to a sequence of two portions of nucleic acid, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with two or more portions of the nucleic acid, and observing a detectable change brought about by the hybridisation. The nucleic acid to be detected must have at least two portions and the distances between these are chosen so that when the nanoparticle-oligonucleotide conjugate binds the target sequence a detectable change occurs. The method of the invention is useful for detecting two or more nucleic acids (from a biological source) having at least two portions, such as viral RNA, bacterial or fungal DNA, a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection of nucleic acid having -2 portions used to prepare biomaterials and in nanofabrication methods, comprises providing nanoparticles, contacting nucleic acid and nanoparticles, and observing change.
                                                                                                                                                                                                                                                                                                                                                                                                                         Nanotechnology; nucleic acid detection; nanofabrication; nanoprobe; ss.
equipment, and little or no instrumentation is required. The present sequence represents a thiol modified oligonucleotide sequence used to demonstrate the method of the invention

or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. Nanoparticle-oligonucleotide conjugates of the invention care useful for preparing a nanoprobe conjugate for detecting an analyte, and for detecting a nucleic acid bound to an electrode surface.

Nanoparticles and nanoparticle conjugates of the invention are useful for nanofabrication and for separating a selected nucleic acid having two portions from other nucleic acids. Diagnostic assays employing nanoparticle-oligonucleotide conjugates improve the sensitivity of nucleic acid detection methods and can be used to detect nucleic acids that are present in only small amounts in a sample. The invention also provides highly desirable nanoparticle-oligonucleotide conjugates. These conjugates are stable with tailored hybridisation abilities. The present conjugates at thiol modified oligonucleotide sequence used to
                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nanotechnology; nucleic acid detection; nanofabrication; nanoprobe; ss.

Ting invention relates to a novel method for defecting nucleic acids. The method comprises providing nanoparticles with oligonucleotides attached to them, which have a sequence complementary to a sequence of two to them, which have a sequence complementary to a sequence of two to them, which have a sequence complementary to a sequence of two complementary and an anoparticles of the nucleic acid, and observing a detectable change brought about by the nucleic acid, and observing a detectable change brought about by the hypridisation. The nucleic acid to be detected must have at least two portions and the distances between these are chosen so that when the nanoparticle-oligonucleotide conjugate binds the target sequence a detectable change occurs. The method of the invention is useful for detecting two or more nucleic acids (from a biological source) having at least two portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction are useful for preparing a nanoprobe conjugates of the invention are useful for preparing a nanoprobe conjugates of the invention are useful for preparing a nanoprobe conjugates of the invention are useful for nanoparticle-oligonucleotide conjugates of the invention are useful for nanoparticle-oligonucleotide conjugates improve the sensitivity of nanofabrication methods and can be used to detect nucleic acids detection methods and can be used to detect nucleic acids or provides highly desirable nanoparticle-oligonucleotide conjugates improve the sensitivity of conjugates are stable with tailored hybridisation abilities. The present conjugates are stable with ainvention abilities. The present conjugates the method of the invention abilities. The present conjugates are invention and inven

                                                                                         The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermaitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                eczema,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of treating non-allergic inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of treating non-allergic inflammatory disease comprishing administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a hairpin sensor comprising a hairpin loop assembly including a complementary probe positioned between a first assembly including a complementary probe positioned between a first inverse repeat arm and a second inverse repeat arm, and a quenchable inverse repeat arm of the hairpin loop assembly opposite the second inverse repeat arm of the hairpin loop assembly opposite the hairpin sensor, where the end of the first inverse repeat arm opposite the complementary probe is bound, directly or indirectly, to a support, a kit complementary probe is bound, directly or indirectly, to a support, a kit complementary probe. The hairpin sensor system, in which the particle is conductive or semi-conductive, in asmple comprises a functional group joined to the end of the first inverse repeat arm, the functional group selected from amino, carboxyl, thiol and hydroxyl. Purther, the sensor comprises a ligand positioned between the second inverse repeat arm and the quenchable fluorescing entrile and carboxyl, carbo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hairpin sensor useful for detecting a target nucleotide sequence in a sample, comprises a hairpin loop assembly including a complementary probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /bound_moiety= "Hairpin oligonucleotide #2" /note= "Forms a doube-stranded region with the hairpin oligonucleotide shown in examples 3, 4 and 5"
                                                                                                                                                          Hairpin sensor; hairpin loop; complementary probe; inverse repeat arm quenchable fluorescing agent; microarray; semiconductor; nanocrystal; rhodamine B-labelled dye; detection; gold support; ss.
                                                                          Hairpin target sequence, #2, used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Locascio M, Landry DP;

The invention relates to detecting a nucleic acid (NA) having at least 2 portions comprises providing a type of nanoparticles (NP. e.g. colloidal gold) having oligonucleotides (O) attached (where (O) on each NP has a sequence complementary to sequence of at least two portions of NA), contacting NA, and observing a detectable change brought about by opticians of (NA, and observing a detectable change brought about by obticiantion of (O) on NP with NA. Also included are aggregate probes, over probes, substrate having NP attached to it, a metallic or semiconductor NP having (O) attached to it, inanomaterials/manostructures comprising nanoparticles and methods of nanofabrication utilising nanoparticles and satellice probes. The methods, probes nucleic acids, nanoparticles and oligonucleotides are useful for separating selected cultiplication conductor and lagonucleotides are useful for separating a selected cultiplication conductor acids, and conduction nucleic acids, and for detecting nucleic acids having at least two portions, from other nucleic acids, and for detecting and least two portions, for detecting any naving at least two portions is useful for detecting any

type of nucleic acids which may be used for diagnosis of disease and in detecting of nucleic acids. Preferably, the method is useful for detecting nucleic acids for diagnosis and/or monitoring of viral diseases (human immunodeficiency virus, hepatitis virus, herpes virus, sexually transmitted diseases, inherited diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication, for monitoring gene therapy, etc. The method is useful in research and analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, etc. Detecting nucleic acids based on observing a colour change with the naked eye is cheap, fast, simple and robust, and do not require specialised expensive equipment. The present sequence is a spacer oligonucleotide used to illustrate the method of the

Nanotechnology; nucleic acid detection; nanofabrication; nanoprobe; ss. Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change. Nanotechnology nucleic acid detection method oligonucleotide #54 Elghanian R; Storhoff JJ, /mod\_base= OTHER /note= "OTHER= Thiol modified" Mucic RC, Location/Qualifiers 20 AAAAAAAAAAAAAAAAA ACD26995 standard; DNA; 20 BP. 96US-0031809P 97WO-US012783. 99US-00240755. 20-SEP-2001; 2001US-00957318 99US-00344667 2000US-0200161P 26-JUN-2000; 2000US-00603830 15-OCT-2003 (first entry) \*tag= a Letsinger RL, (NANO-) NANOSPHERE INC. to them, which have a sequence complementary to a sequence of two controls and contacting the nucleic acid, and observing the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with two or more portions of the nucleic acid, and observing a detectable change brought about by the nucleic acid, and observing a detectable change brought about by the hybridisation. The nucleic acid to be detected must have at least two portions and the diseances between these are chosen so that when the nanoparticle-oligonuclectide conjugate binds the target sequence a detectable change occurs. The method of the invention is useful for detecting two or more nucleic acids (from a biological source) having at cleast two portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction and for preparing a nanoprobe conjugate for detecting an analyte, and for detecting a nucleic acid bound to an electrode surface. Nanoparticles and nanoparable conjugates of the invention are useful for nanofabrication and for separating a selected nucleic acid having two cortions from other nucleic acids. Diagnostic assays employing consorparticle-oligonucleotide conjugates improve the sensitivity of mucleic acid detection methods and can be used to detect nucleic acids that are present in only small amounts in a sample. The present sequence the are present at the invention of the invention and constrate the are present and encounted and can be used to detect nucleic acids that are present in only small amounts in a sample. The present sequence the are present and the present and the detection methods and can be used to detect nucleic acids that are present sequence the are present sequence. method comprises providing nanoparticles with oligonucleotides attached Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament. The invention relates to a method of treating or preventing allergy or Gaps ö ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory. asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosling and/or treating asthma and allergy especially in a hypo-responative subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

PCR primer for amplifying the ATP dependant DNA helicase gene #SEQ ID 68.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA amplification; copy number; polymerase chain reaction; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

haematopoietic activity and the polynucleotides encoding them. The polypeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, for improving engraftemen of bone marrow transplants, for enhancing bone marrow recovery after radiotherapy or chemotherapy and in treatment of immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polypeptides and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents SCF related DNA of the
                                        New non-natural stem cell factor, useful for treating e.g. leucopenia or immune deficiency, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of nucleic acid having at least two portions comprises contacting the nucleic acid and nanoparticles under conditions to allow hybridization of the oligonucleotides, and observing detectable change

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                      The invention relates to a method for the amplification of DNA that maintains genes and copy number of the sequence. This method is useful for easy and operable amplification of DNA. The method was carried out by fragmentation genomic DNA, preparation of blunt end of the fragmented DNA, ligation of an adapter to the blunted DNA, PCR of the ligated DNA in 2 steps, and confirmation of the amplified APC gene. The current sequence represents a PCR primer used in an example from the invention.
                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stem cell factor; SCF; haematopoietic activity; infertility; intestinal damage; myeloproliferative disorder; leucopenia; thrombocytopenia; anaemia; bone marrow transplant; imune deficiency; neoplasia; nerve damage; osteoporosis; metastatic carcinoma; leukaemia; miliary tuberculosis; haematopoietic progenitor cell; ss.
